CISCO

Cisco DNA Center software version 2.3.3x
Key Features

Cisco DNA Center
software version 2.3.3x

How does it compare
with previous versions?

Inventory visibility

Gain enhanced visibility into the lifecycle of your devices. Track End of Life dates for hardware & software of your wired network devices.

Previously, the only way to track End of Support was to manually investigate all Cisco EoS notifications. Now, Cisco DNA Center generates weekly EoS reports automatically for you!

Assurance

Get more value out of your existing 3D maps with the ability to view AP interference from adjacent floors. You can also see endpoint locations in 3D using DNA Spaces.

Previously, 3D maps were limited to visualizing the AP heatmaps per floor. Now, the additional context allows for considerably more accurate site planning and issue detection.

Security

Improve threat detection by letting Cisco DNA Center cross-check your network activity against TALOS's list of disreputable websites, allowing you to quickly target potentially compromised endpoints and automatically quarantine them.

Previously, Cisco DNA Center was able to identify potentially compromised endpoints by how they acted. Now, TALOS and the Cisco ISE-powered quarantine give you an extra layer of defense to limit the damage compromised endpoints can cause.

Integrations

Monitor every aspect of your network by combining Splunk's visualization capabilities with all the power of Cisco DNA Center.

Previously, there was no way to automatically pull data from Cisco DNA Center and display it within Splunk. Now, the new DNA Center app on a Splunk Enterprise server gives you ten fully customizable dashboards of Cisco DNA Centers' data within Splunk.
